

CFAC universality stratification: $\mathcal{C}_k$ ($k \geq 2$) at a glance

(A) Rate space (a, b, c) of cubic DSE kernel

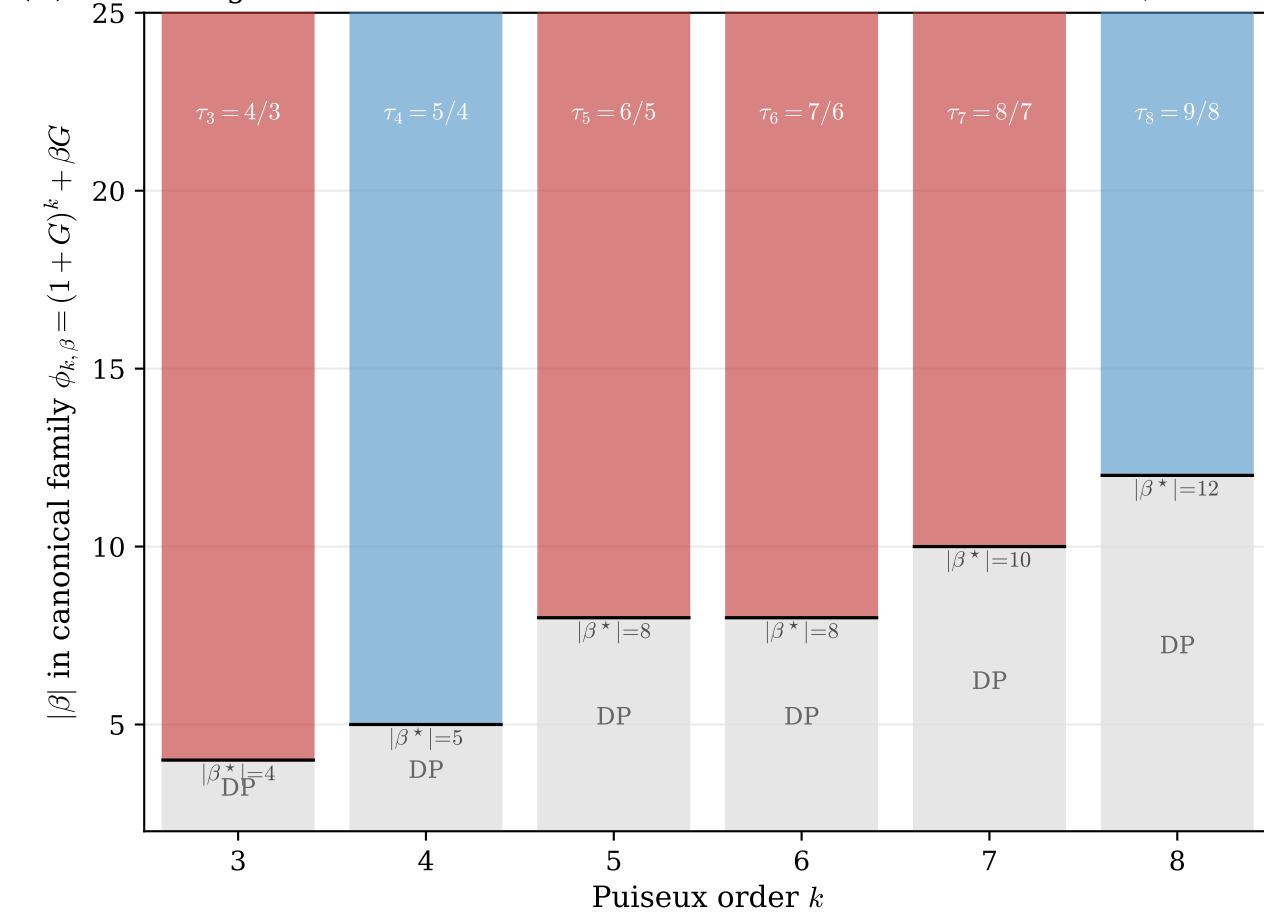

$\mathcal{C}_3$: $b^3 = 27c^2$ (red) separates universality classes

(B) Universality ladder: an infinite family of exponents, every odd k forbidden

(C) Phase diagram: red = Banderier-Drmotat-forbidden stratum reached; blue = allowed

(D) Radius-of-convergence surface $|z_*(b, c)|$ at $a = -1$

$\mathcal{C}_3$ sits on the ridge (cube-root cusp)
